

VAMSI SAI MANGAPATHI

Frontend Developer | React.js | Next.js | TypeScript | JavaScript

Bangalore, Karnataka • vamsisai.mangapathi@gmail.com • +91 7013917151 • [linkedin.com/in/vamsi-sai-mangapathi](https://www.linkedin.com/in/vamsi-sai-mangapathi)

ABOUT ME

I'm a Frontend Developer with around 4 years of experience, mostly working with React.js, Next.js, and TypeScript. At Terralogic, I've been a core part of building Blazeup — a large-scale HR platform — where I handled everything from component architecture to API integration across multiple modules. I genuinely enjoy the craft of building interfaces that feel smooth and intuitive, and I take pride in writing code that's easy for other developers to read and build on. I work well with designers and backend teams, and I'm always looking for ways to make things faster, cleaner, or easier to maintain.

TECHNICAL SKILLS

Languages	HTML5, CSS3, JavaScript (ES6+), TypeScript
Frameworks & Libraries	React.js, Next.js, Vite.js, Node.js
State Management	Redux, Redux Toolkit (RTK), RTK Query, Zustand
UI & Design	Tailwind CSS, Ant Design, Shadcn/UI, Storybook, Figma
Testing	Jest, React Testing Library
Tools	Git, GitHub, GitLab, Postman, Swagger
Backend Basics	Node.js, Express.js, MongoDB, REST APIs, MVC
Performance	Web Vitals, Lighthouse, SSR, lazy loading, image optimisation

WORK EXPERIENCE

Terralogic Software Solutions — Software Engineer II (Frontend Developer)

August 2022 – Present | Bangalore, Karnataka

My main project here has been Blazeup, an HR platform that covers the full employee lifecycle — from the day someone joins a company to the day they leave. It's a fairly complex system with a lot of moving parts, and I've worked across most of the modules at some point. Here's a bit of what I've been up to:

- I built and maintained a shared component library of 30+ components using Storybook. Having these ready-to-use components cut down development time noticeably — the team didn't have to reinvent the wheel every time a new module needed a data table or a modal.
- Performance was something I kept a close eye on. Using Next.js features like SSR, lazy loading, and proper image handling, I brought overall page load performance up by around 20%, which made a real difference for users on slower connections.
- I worked closely with our designers during handoffs and made it a habit to flag things early — if a design wasn't going to translate well to code, or if there was a simpler way to achieve the same result, I'd bring it up. This saved a lot of back-and-forth and helped us ship cleaner UI faster.
- For state management, I used Redux Toolkit and RTK Query for the heavier global state and API caching needs, and Zustand wherever something lighter made more sense. Getting this balance right kept the codebase from getting bloated as new modules were added.
- API integration was a big part of the day-to-day work. I hooked up the frontend to REST endpoints across all the modules, making sure errors were handled gracefully and that loading states actually told the user something useful.
- I wrote unit and integration tests using Jest and React Testing Library, especially for the more critical flows. It's not the most glamorous part of the job, but it's saved the team from some painful production bugs.
- We worked in two-week sprints and I was an active participant in planning, reviews, and retrospectives. I also did a fair amount of code reviewing for teammates, which I found genuinely useful for keeping the codebase consistent.

Modules I worked on in Blazeup:

- **Onboarding & Offboarding:** This was one of the more involved modules. For onboarding, I built the screens for document collection, task checklists, and welcome kit tracking. For offboarding, I handled the clearance workflow, asset return tracking, exit interview forms, and the multi-step approval chain across departments.
- **Asset Management:** Screens for tracking which assets were assigned to whom, handling return requests, and showing the history of each asset's movement across the organisation.
- **Performance Appraisal (EPAS):** The goal-setting and review cycle screens — employees could set their goals, do self-reviews, and managers could evaluate them through a structured flow.
- **Task & Project Management:** A Kanban-style task board with filters, priority flags, and due date alerts. Also built out the project-level views for billing rates, resource allocation, and progress tracking.
- **Customer Management:** Profile pages and management screens for customers, including their agreements, site locations, and key contacts.
- **Ticket Management:** Built a support ticket system where employees could raise issues, track their status, and get updates as things moved through the resolution process. Also included views for team leads to triage, assign, and close tickets.
- **Employee Management:** Screens for managing employee profiles, department assignments, reporting structures, and employment details. HR teams could update records, view org hierarchies, and manage role-based access from a central place.

A bit of backend too:

- I've spent some time on the backend side as well — building REST APIs with Node.js, Express, and MongoDB. I handled things like CRUD operations, request validation, middleware, and basic JWT auth. It's helped me understand the full picture and communicate better with backend engineers.

PROJECTS

Blazeup – HR Platform

Stack: *React.js, Next.js, TypeScript, Redux Toolkit, Zustand, Tailwind CSS, Storybook, Vite.js*

The main product I've worked on at Terralogic. It's a multi-module HR platform that handles the full employee lifecycle — hiring, onboarding, performance reviews, asset tracking, task management, and offboarding. I was involved in building and maintaining most of the frontend, including the shared component library and the module-level state and API integration.

Personal Portfolio

Stack: *React.js, Tailwind CSS, Vite.js*

A personal site I built to showcase my work and skills. I kept performance in mind throughout — it scores 95+ on Lighthouse. Built with SSR for fast initial loads and fully responsive across devices.

EDUCATION

M.Sc. Computer Science

Krishna Chaitanya PG College, Andhra Pradesh / 2019 – 2021

CERTIFICATIONS & COURSES

- React – The Complete Guide – Udemy
